

**CHRIST (Deemed to be University)**  
**Department of Computer Science**  
**MSc – Data Science**  
**Create GA4 Configuration for Enhanced Metrics**

Course: Web Analytics  
Lab No: Lab 2  
Date; 16-01-2021  
Name: Harsha KG  
Reg\_No:2248035

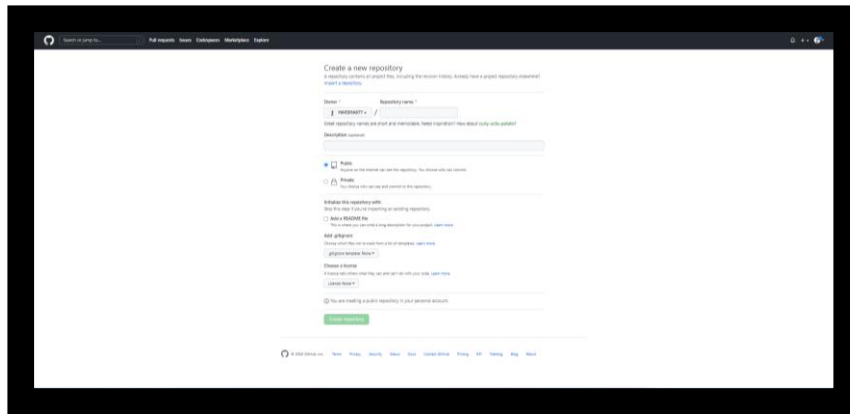

- Log in to GitHub  
➔ Sign in with username and password

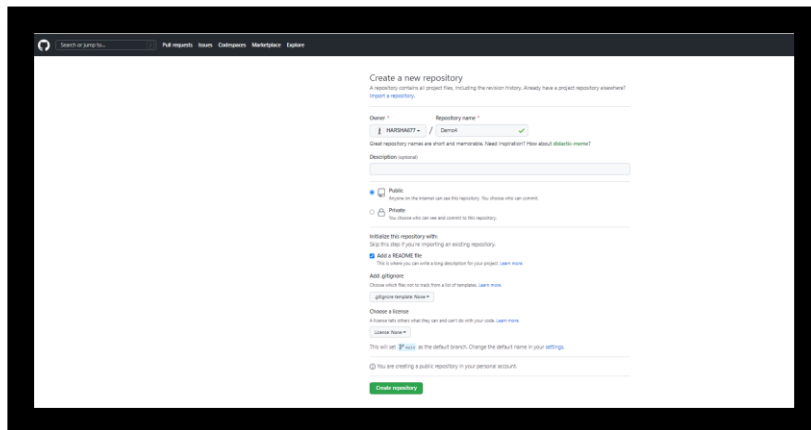

- Go to the Home page  
➔ Click on the + button on the right side of the page  
➔ Click on the new repository

- Create a new repository  
➔ Provide a name for the repository

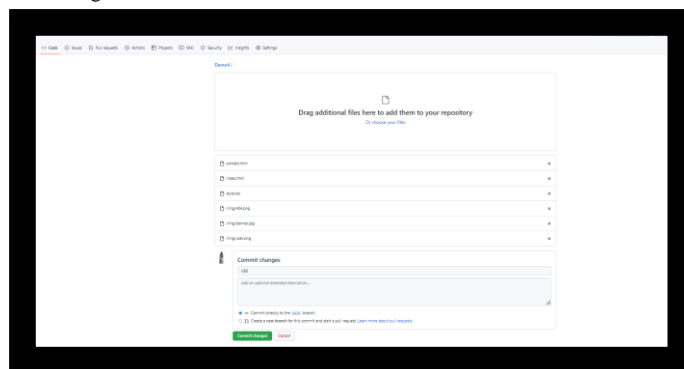

→ Click the tick in the checkbox of Add a README file.

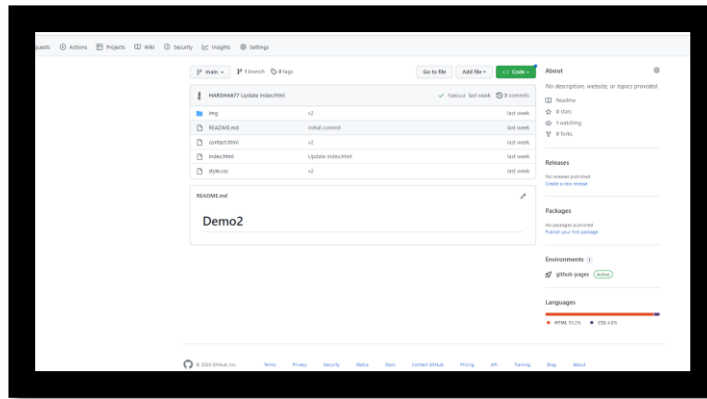

Here, we gave the repository name Demo2.

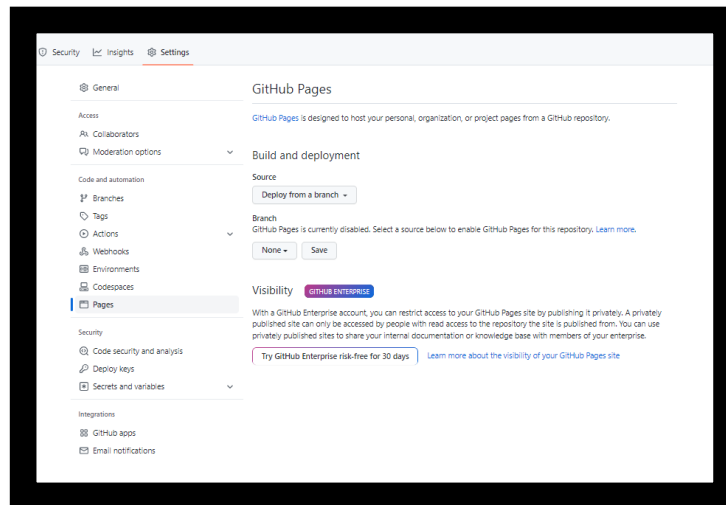

→ After that, click on create a repository.

- Go to settings → Click on Add file → upload files
  - Drag the WA folder downloaded to the PC  
[WA folder consists of an image file, contact.html, index.html, and style.css file]
  - Provide the version name (V2)
  - Click on Commit changes

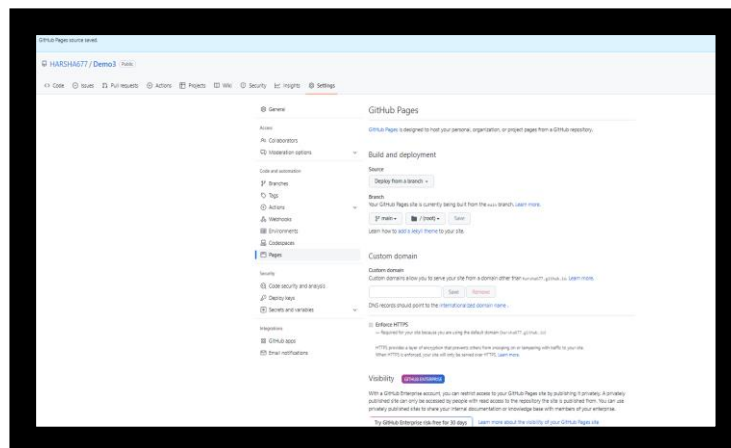

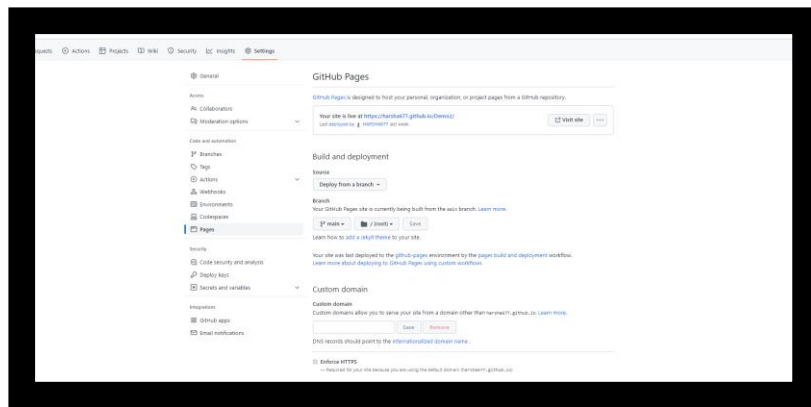

- Go to Settings → Pages

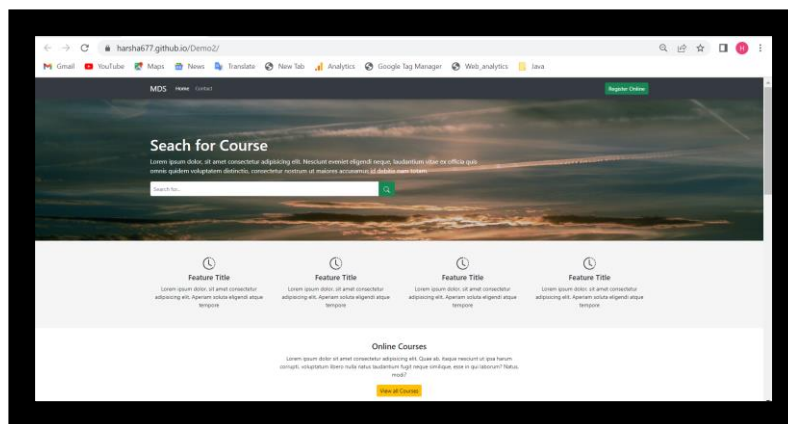

- ➔ In pages, select branch as main and click on save

- ➔ Reload the page, and the website will be live
- ➔ Click on view site

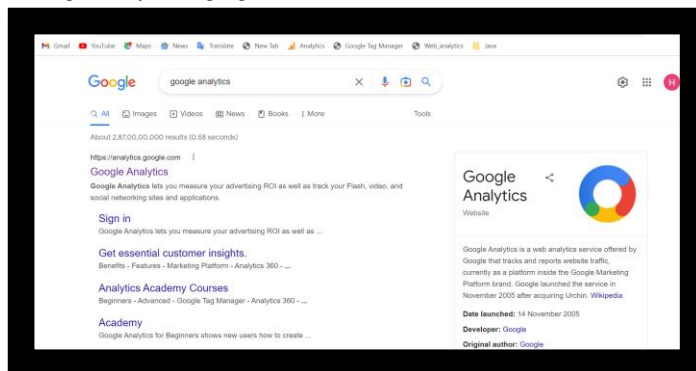

➔ View of website

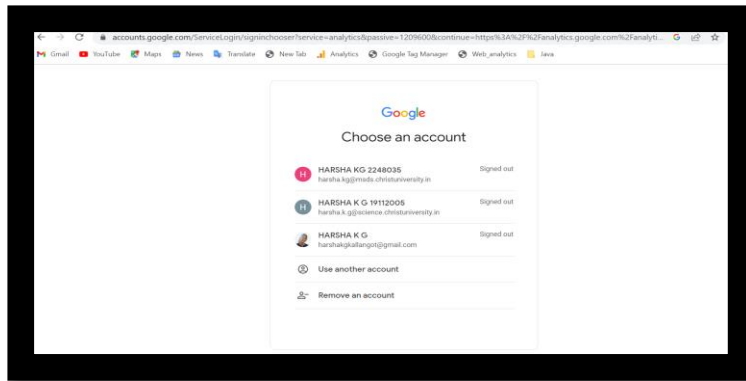

Thus, the website is created and hosted on GitHub.

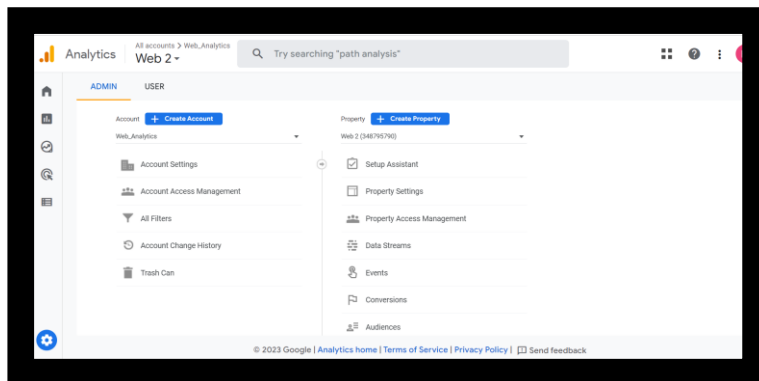

- Search Google Analytics in google search

- Login using Gmail id

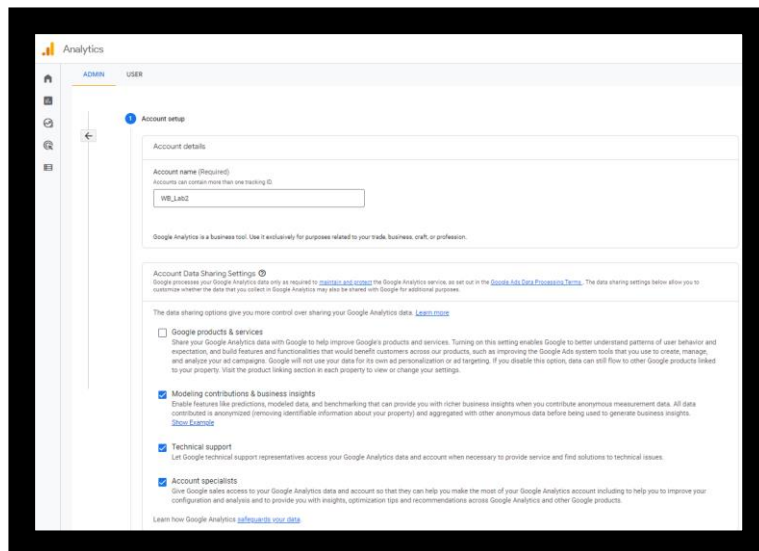

- Go to Admin

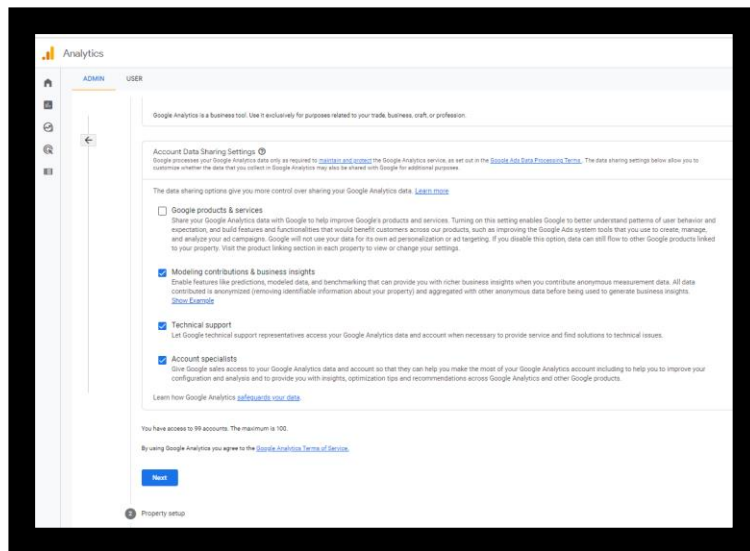

#### Account setup

- ➔ Click create account
- ➔ Provide an account name

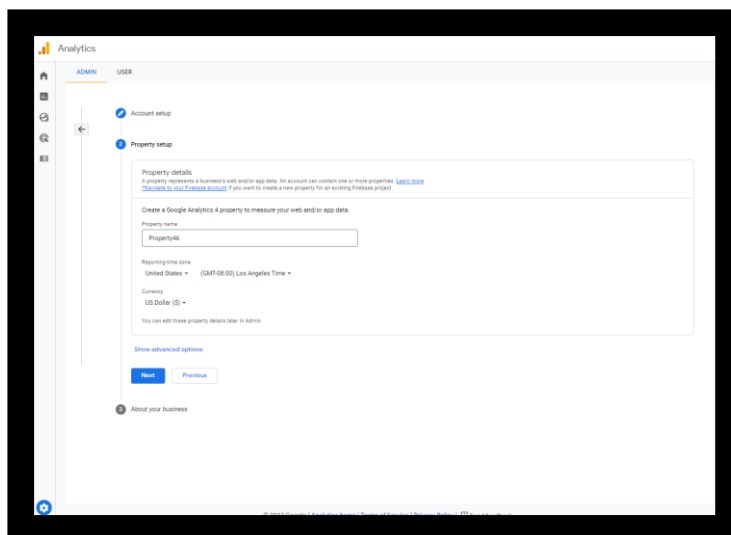

- ➔ Here I gave the account name WB\_Lab2
- ➔ Click on Next

Thus, the Account is created in google analytics.

#### Property setup

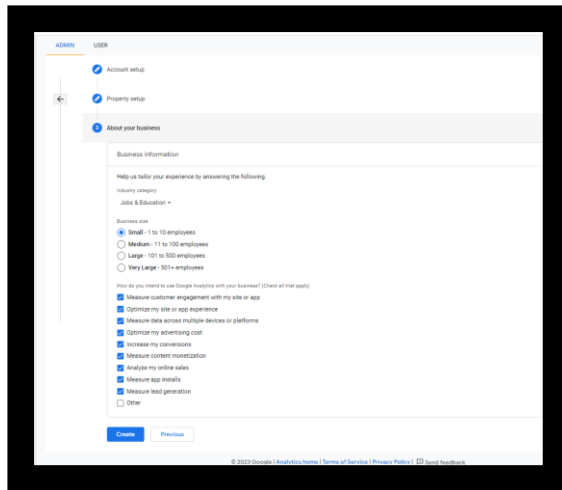

- ➔ Once the Account is created, GA will redirect to the property and details sections, where we must first create a property name for that account.

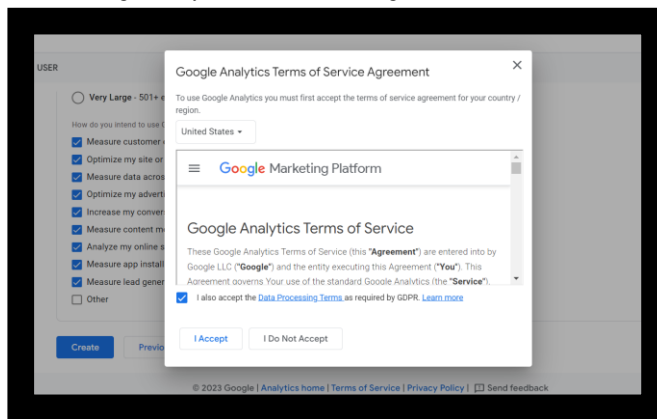

- ➔ I gave the property name Property46.

#### About your business

- ➔ Change the Industry Category to Job and Education
- ➔ Change the business size to small-1 to 10 employees
- ➔ Click on all the tick boxes except other for how to intend to use google analytics with your business
- ➔ Once all these changes are made, click Confirm

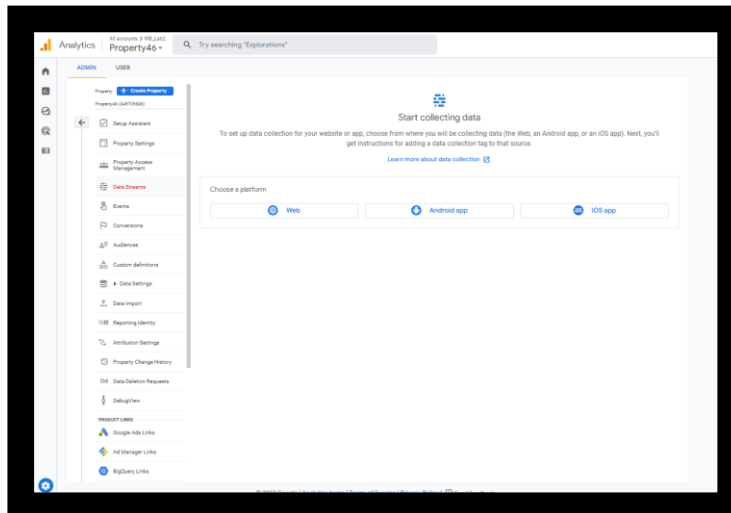

➔ Read the Google Analytics terms of service agreement and tick the checkbox.

- After this, it will be redirected to Data Streams

➔ Choose the platform as Web.

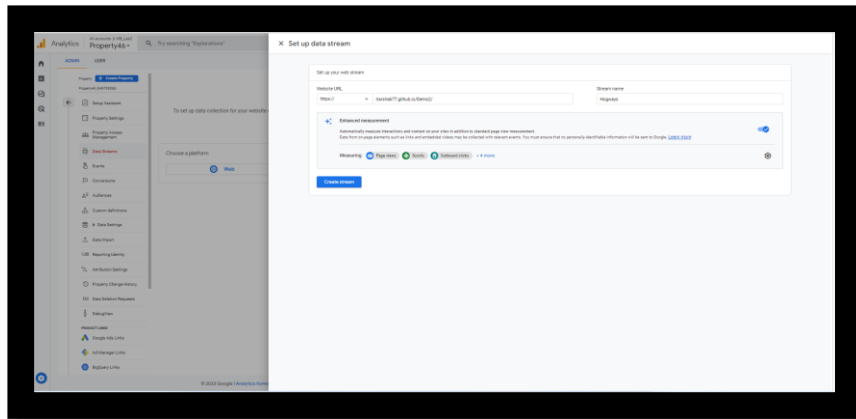

➔ Provide the link of the website hosted in GitHub in the Website URL

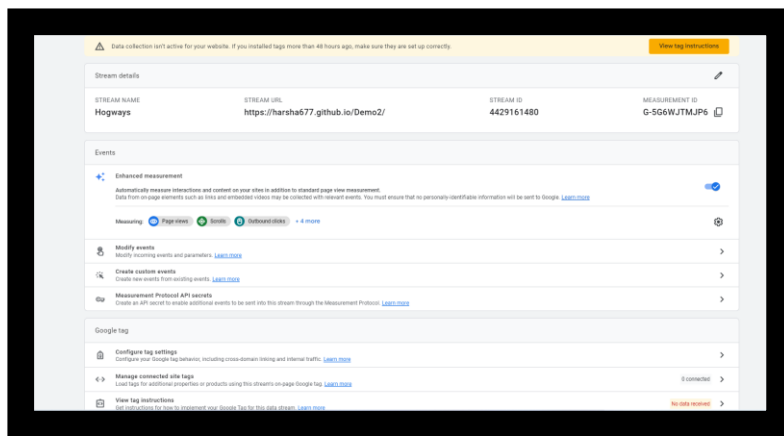

➔ Create a Stream name

*Here, I gave the stream name Hogways*

➔ By default, the enhanced measurement will measure website interaction and content in addition to standard page measurement. Thus, enhanced measurement is enabled.

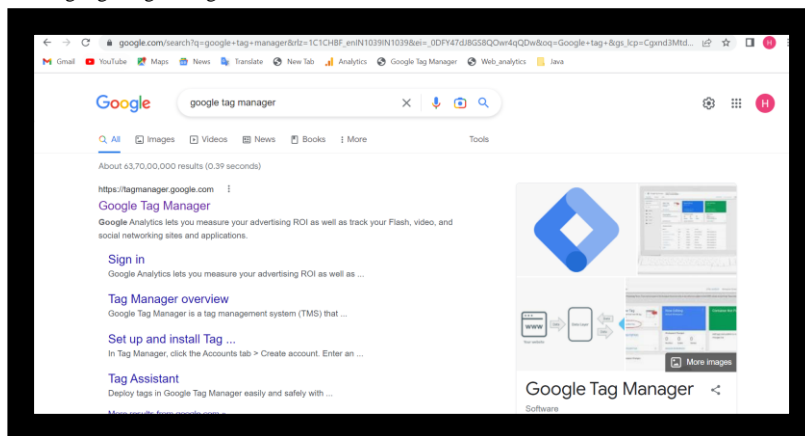

- ➔ After making all these changes click to create the stream.
- ➔ We get Stream details (ie, stream\_name, stream\_url, stream\_id, Measurement\_id)

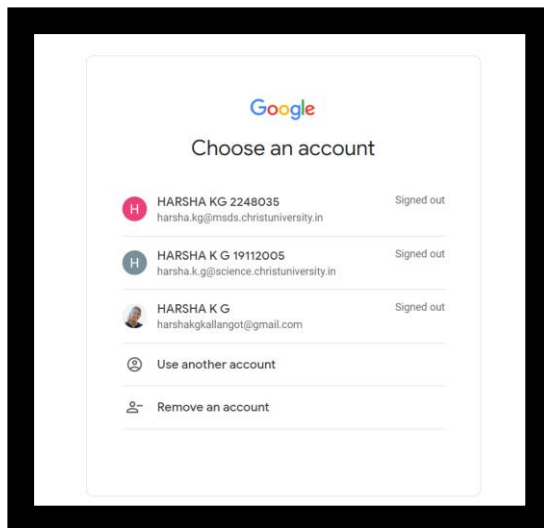

Thus, we added Account and Property (only Default Metrics)

1. Search google tag manager

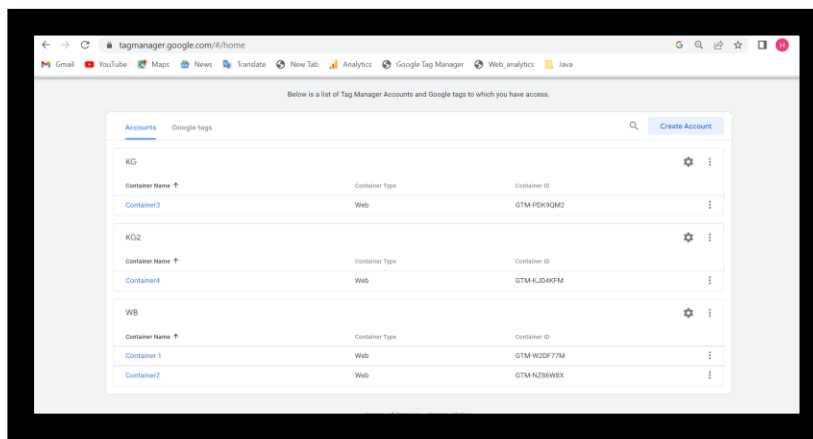

2. Sign in using a Gmail account, which was used to host the website in GitHub and to create an account in GA

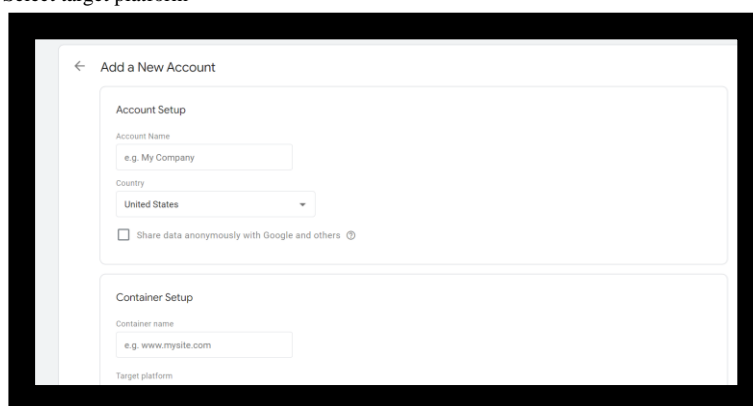

3. In Account
  - ➔ Click on Create Account

- ➔ In the account setup, provide the account name for tagging
- ➔ In the container setup, provide the container name
- ➔ Select target platform

Here, I gave

- ➔ The account name as RK
- ➔ Container name as Container5
- ➔ Target platform as Web

The image shows the Google Tag Manager setup process. The 'Account Setup' section includes fields for 'Account Name' (with 'RM' entered), 'Country' (set to 'United States'), and a checkbox for 'Share data anonymously with Google and others' which is unchecked. The 'Container Setup' section includes a 'Container name' field (with 'Containers' entered) and a 'Target platform' list. The 'Web' option is selected with a checkmark. Other options include 'iOS', 'Android', 'AMP', and 'Server'.

- ➔ Accept the google tag manager terms of service agreement
- ➔ click Yes

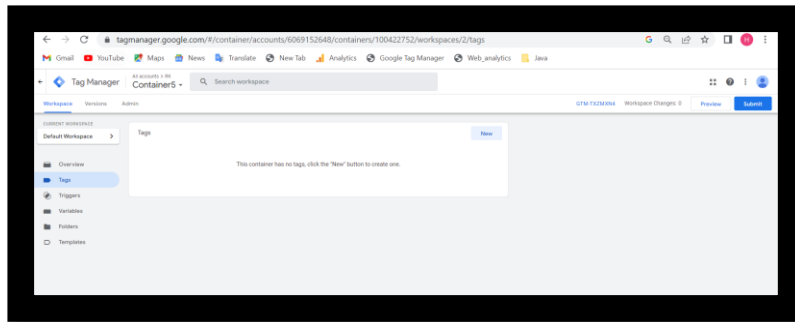

The image shows the 'Google Tag Manager Terms of Service Agreement' page. It contains detailed legal text regarding the use of the service, including links to the Google Privacy Policy and the Google Tag Manager Use Policy. At the bottom right, there is a blue 'Yes' button to accept the terms.

- ➔ Thus, tagging code is generated.

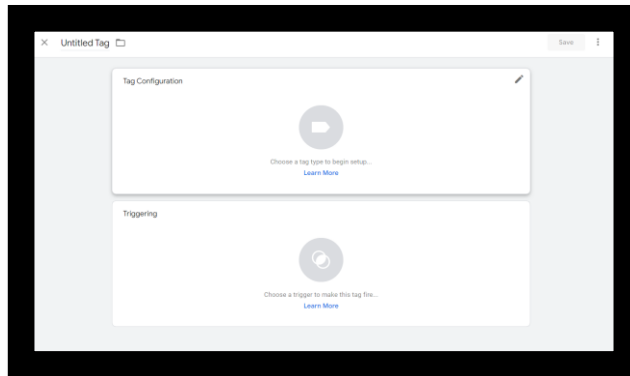

The image shows the Google Tag Manager interface. A 'New Tag' dialog box is open, displaying the generated tracking code for the selected tag. The code is a JavaScript snippet that includes the Google Tag Manager library and the specific tag configuration. The dialog also includes a 'Description' field and a 'Workspace Changes' section.

Thus, I created a container in Google Tag Manager.

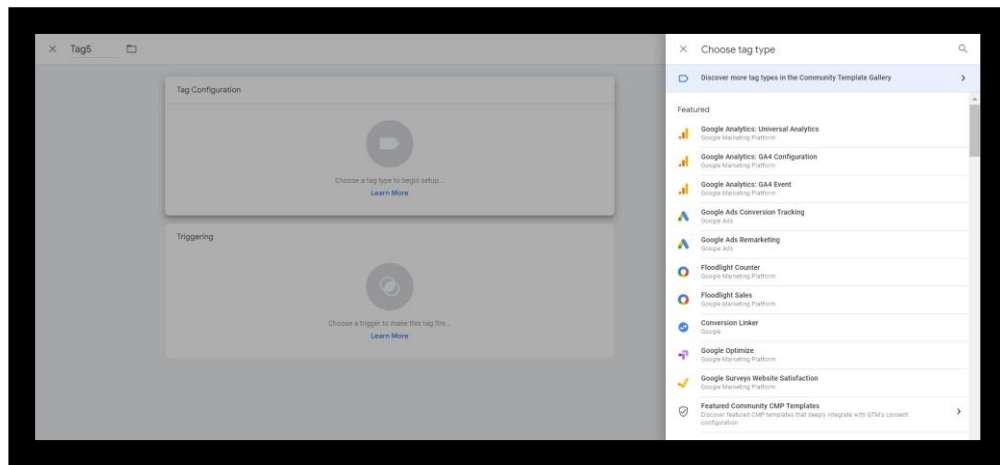

- In workspace ➔ Tags
- ➔ Click New in Tags

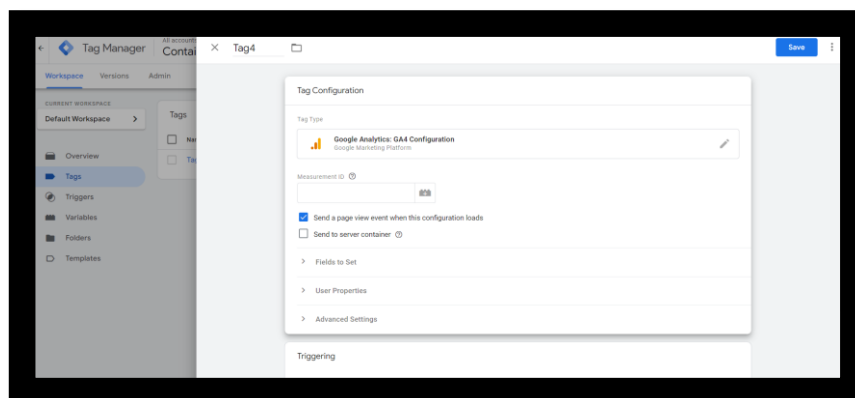

➔ Rename the Tag name

- ➔ Here, I renamed Tag to Tag5
- ➔ Choose the tag type as Google Analytics: GA4 Configuration

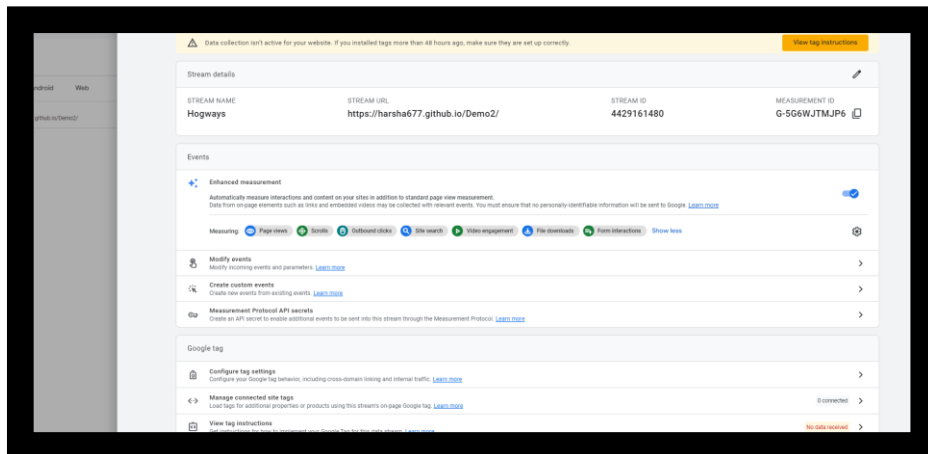

➔ Provide the measurement ID

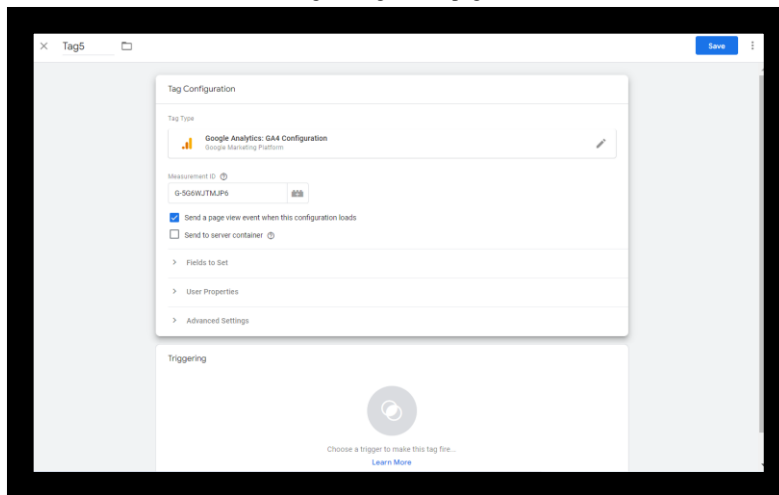

➔ Again, Go to Google Analytics

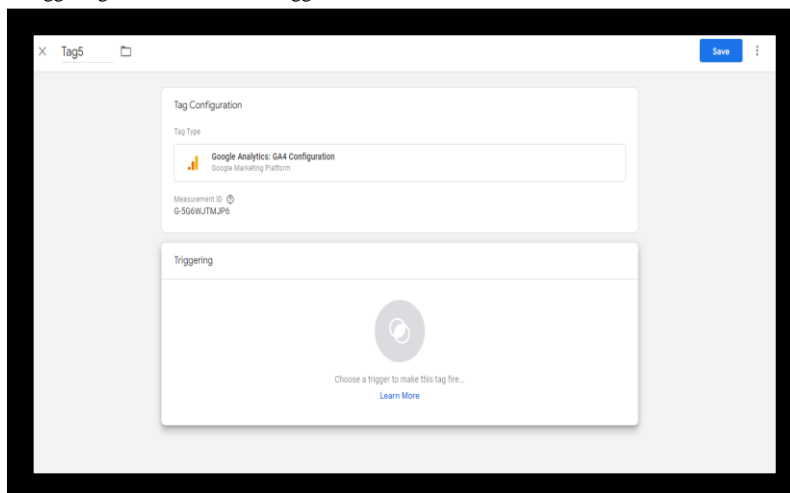

- ➔ In Admin, select Data Streams
- ➔ Copy Measurement ID from stream details

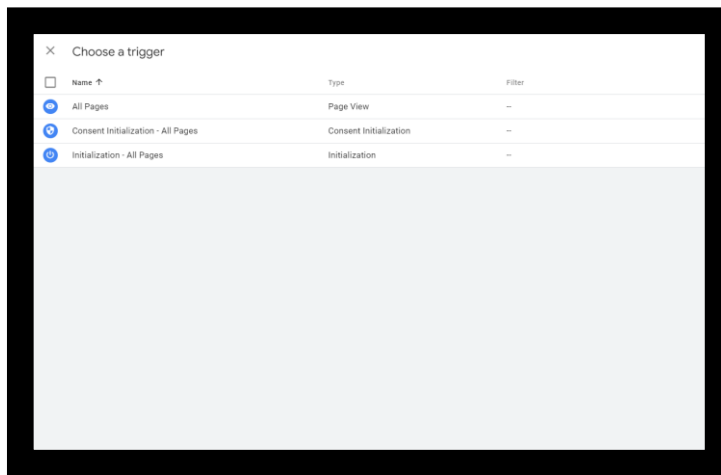

- ➔ Paste the measurement ID in the Tag Configuration page

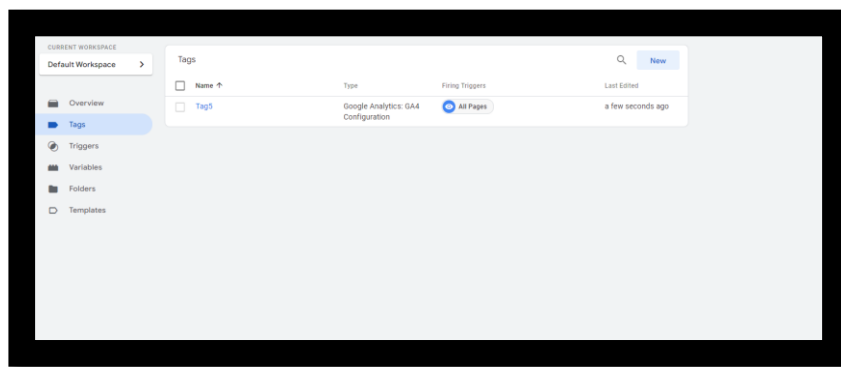

- ➔ In triggering, click on choose a trigger.

- ➔ Choose trigger as All Pages.

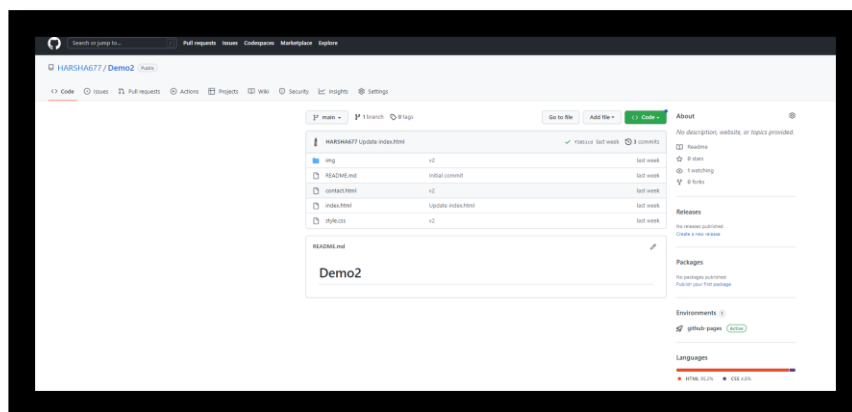

➔ Click on Save

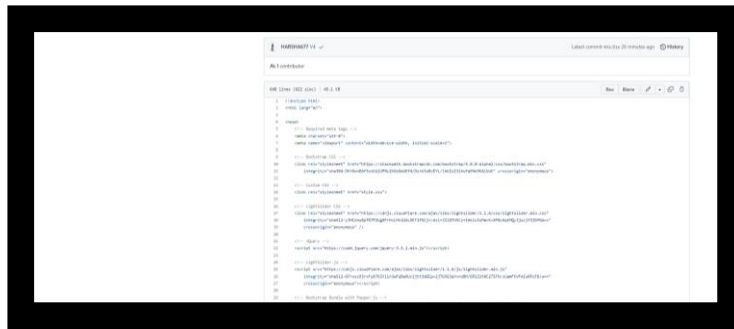

Thus, we created a New Tag

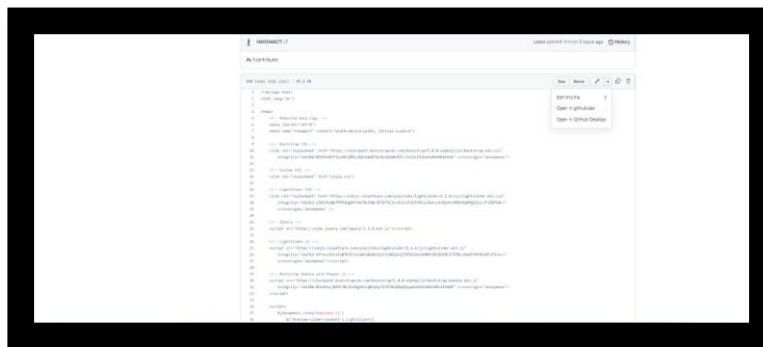

- Now again, Go to GitHub
- ➔ Click on Code

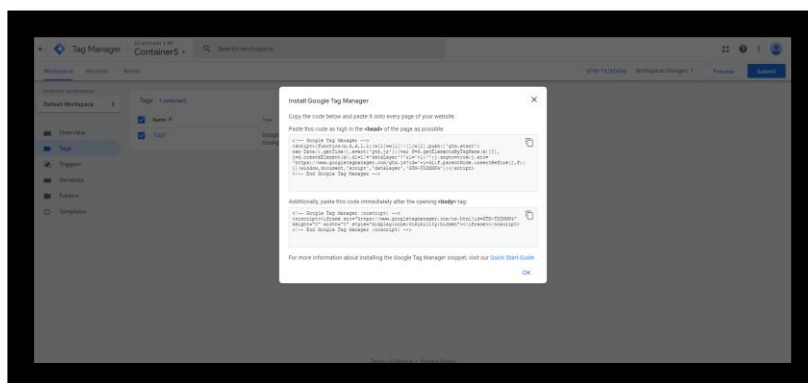

➔ Open index.html file

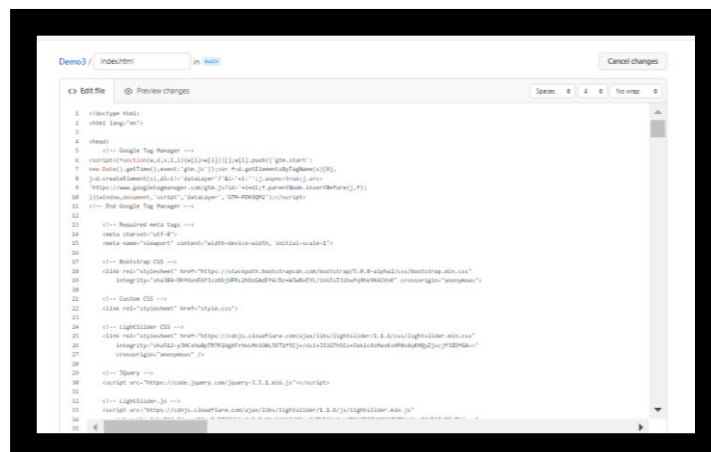

➔ Click on Edit this Files

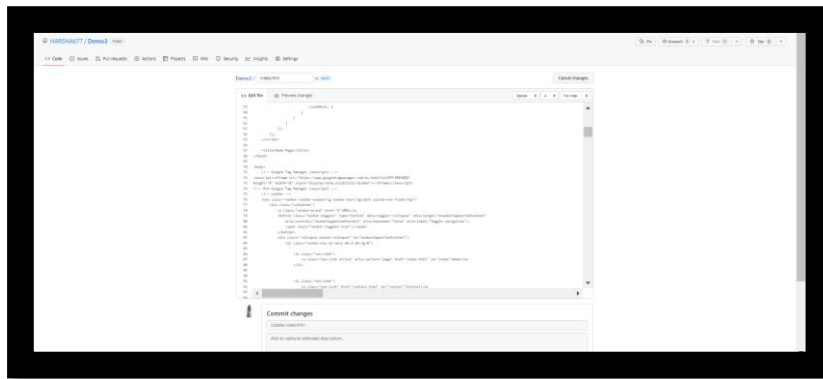

- ➔ Go to GTA (Google Tag Manager)
- ➔ Click on the Tag Manager container
- ➔ Copy the tagging code and paste into the head and body of the code

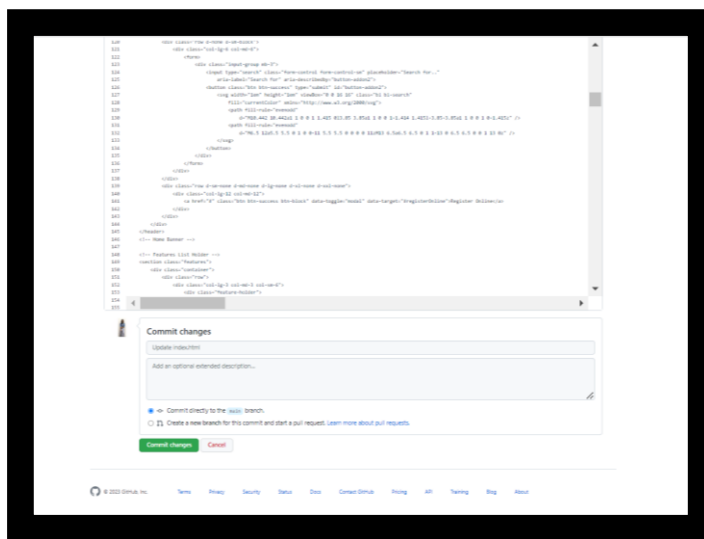

➔ Paste the first code after opening <head> of the page

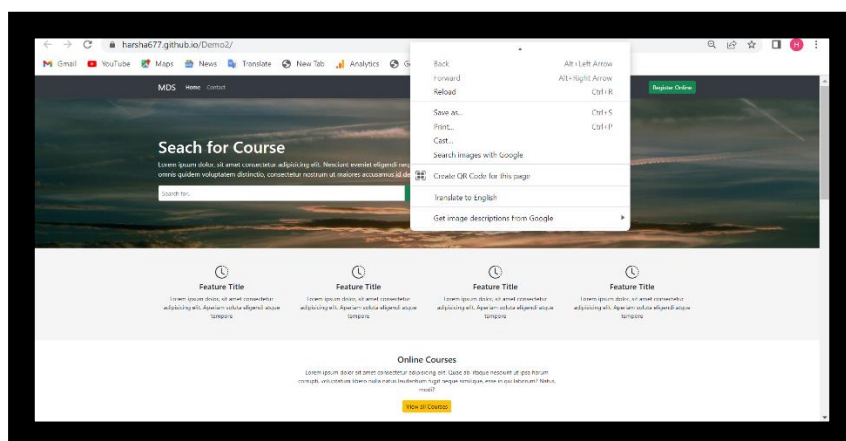

- ➔ Paste the second code after opening <body> of the page

- ➔ Click on Commit Changes

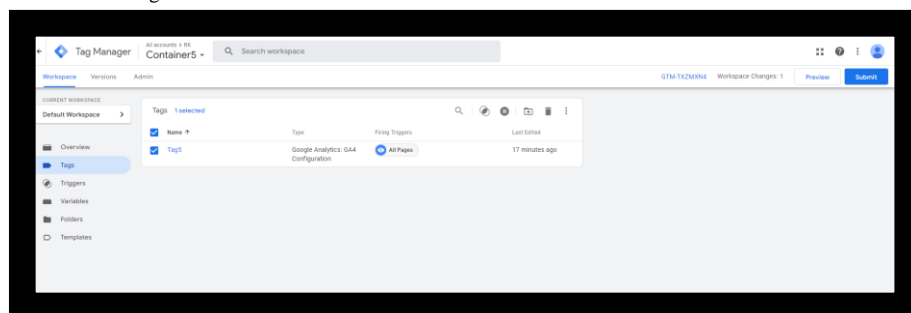

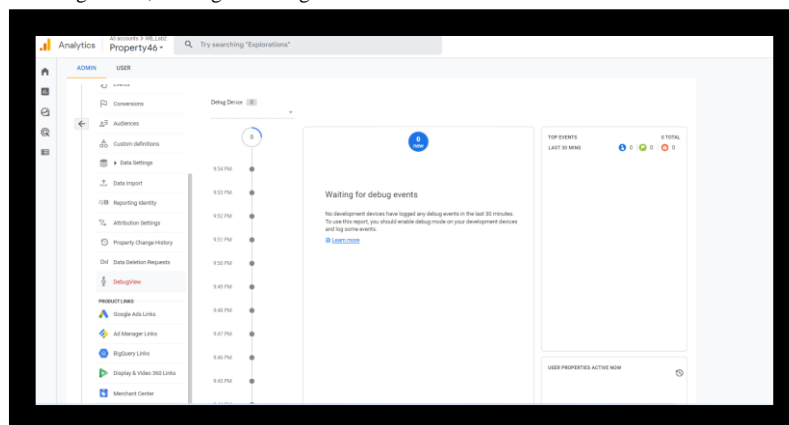

- ➔ Go to the website hosted using GitHub
- ➔ Right Click on the View page source

- ➔ The source code is updated.

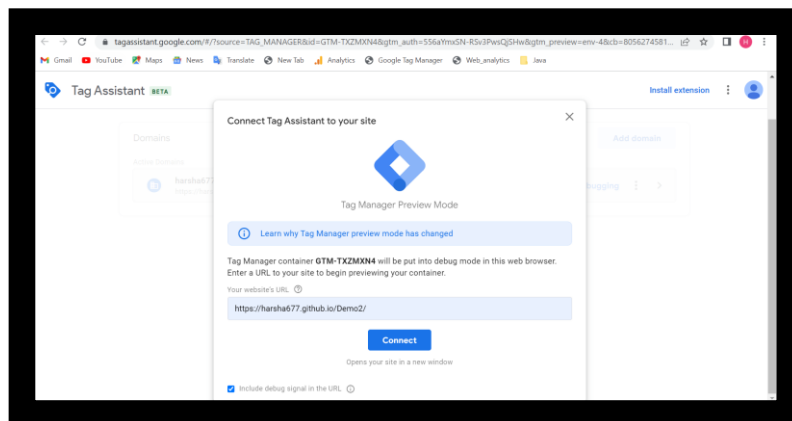

- ➔ Go to GTA➔ Tag➔ Preview

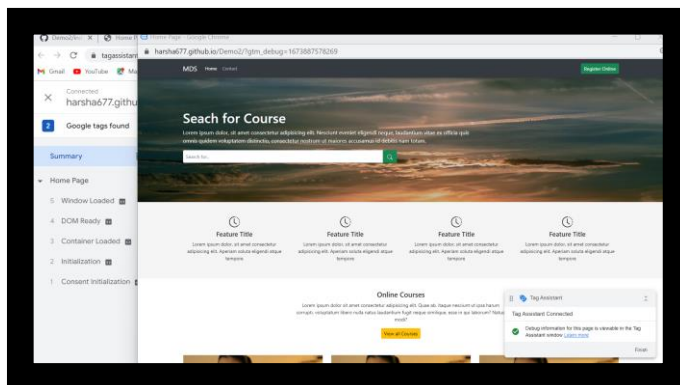

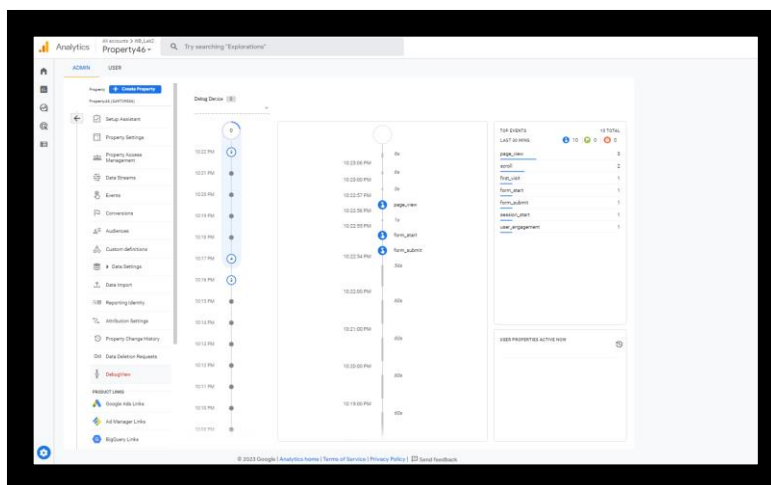

- ➔ To enable debug mode, enter the website URL hosted on GitHub
- ➔ Click Connect

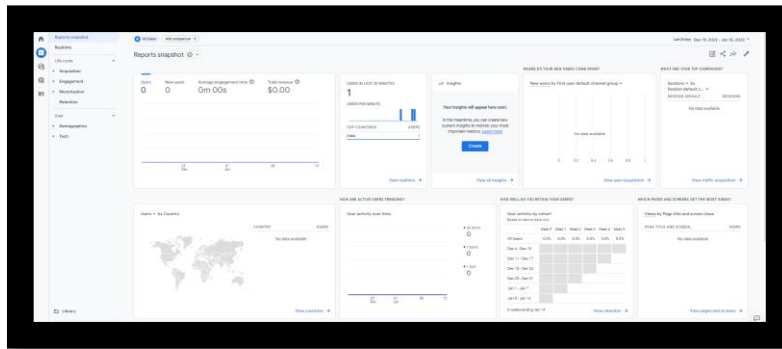

- ➔ The tag is connected. Thus, debug information for this page is viewable on the tag assistant page.
- ➔ Go to the website and perform some operations.

- ➔ Now, go to Analytics → DebugView.

→ We can observe that events are recorded. Thus, we get the report of actions performed on the hosted website.

### Conclusion:

Using GA and GTA, we analyse the events happening on a website (hosted in GitHub) by enabling enhanced metrics.
